Business Problem

Model Limitations

Future Considerations

Model Description

Analysis and Results

Dataset Overview

21,000 property sales in
King County, Washington

Sold between March 2014
and March 2015

Ranging in sale price
between 78k — 7.7M

Overview of King County

The Business Problem

TITLE DEED	
BOARDWALK	
RENT \$50	
With 1 House	\$200
With 2 Houses	\$600
With 3 Houses	\$1400
With 4 Houses	\$1700
With HOTEL	\$2000
Mortgage Value \$200	
Houses cost \$200 each	
Hotels, \$200 each plus 4 houses	
<small>If a player owns all the sites of any color group, the rent is doubled on unimproved sites in that group.</small>

The Stakeholder

Real Estate Tycoon in
King County Washington

The Question

Which properties are
undervalued?

The Solution

Build a model that
accurately predicts price

Bottom Line Up Front

Final Model

Median Absolute Percent
Error of 11.67%

Use Case:

Property 10247 sold for \$415k

Our model predicts a price of \$449k

This property is likely undervalued!

Model Limitations

Focus on Minimizing Error

Individual predictor coefficients may be hard to interpret

Linear/Polynomial Regression

Not the most accurate prediction algorithm available

Baseline Model

Single Feature:

Square feet of living area

Percent Error:

28.51% — We can improve!

Feature Engineering

—

Features Added

Distance to Seattle

Grade

Median Income

HPI

Final Model

Additions:

Distance to Seattle
Overall Grade
Median Household Income
Housing Price Index
Polynomial Regression
Standard Scaling
Log Scaling

Percent Error:

11.67% — A major improvement!

Future Considerations

Explore more accurate
predictor algorithms

Investigate effect of
demographics on sale price

Incorporate property data
from more recent years

Thank you!

Ahmad Samiee

Kyle Lindstrom

Appendix

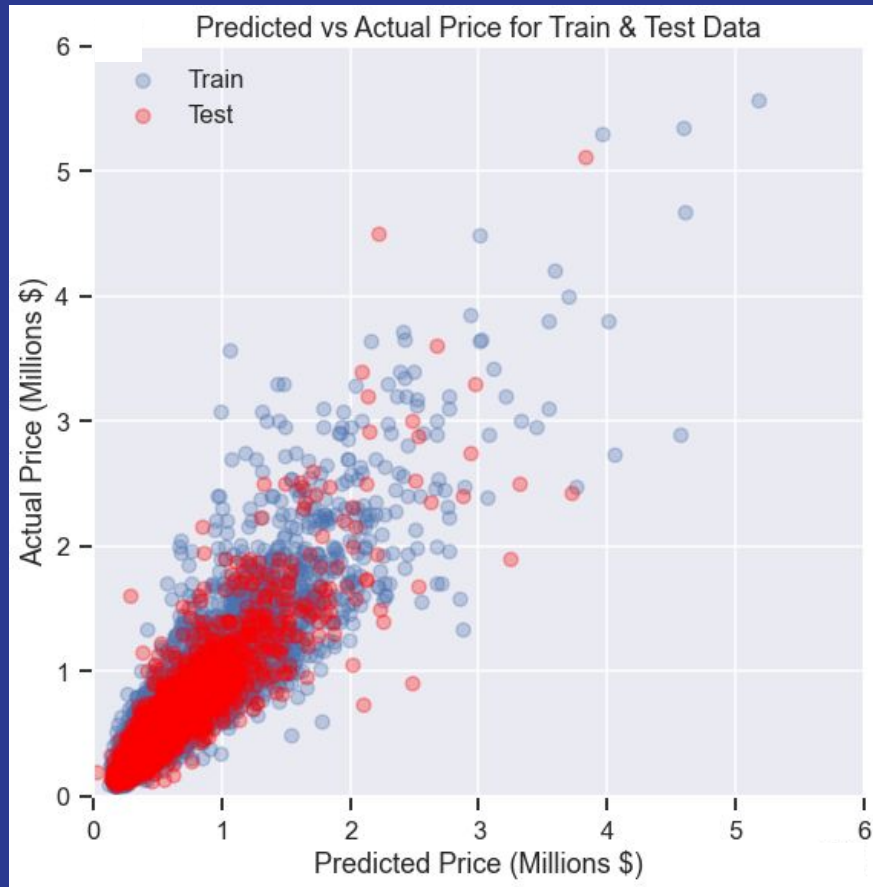

Model building

Testing on Unseen Data

Model Performance:

Median absolute percent error of 12.63%

Linearity vs Nonlinearity

What is the best fit for our data?

The relationship between price and our variables is nonlinear!
